

# Spring Retainers

AOA's most popular designs are considered for correcting minor incisor irregularities such as rotations and tipping. The **Spring Retainer** can also be utilized for passive post orthodontic retention where severe rotations have been corrected. AOA will reposition the incisors ideally or as ideal as the malalignment will allow based on the instructions on the Rx. If requested AOA will reduce (strip) the contacts of each or selected incisors to create sufficient space when constructing the set-up. The appliance is self-activating due to the changes "designed" into the construction model by the set-up based on the Rx. The appliance stretches around the irregular incisors and coaxes them into position. Over-corrections can be introduced into the set-up for additional force if requested on the Rx. TMA may be substituted for AOA's special spring wire.
